# Running jobs on the Prince Cluster

**Accessing the Prince Cluster**
- From Windows workstation
- From Mac workstation

**Software and Environment Module**

**Job script and resource request**
- Introduction to job scheduling
- Submitting jobs with `sbatch`
- Requesting resources
- Using computing nodes interactively

**Monitoring batch jobs**
- Monitoring batch jobs - `squeue`
You can compile, edit scripts and view results on the login nodes, but **computational work should be run on the compute nodes**

- You can access compute nodes with `srun`
  - Either via a job script, or interactively
  - Compute nodes are allocated to jobs by the scheduler, so your job might not start immediately
  - Jobs must request resources, but mostly need not specify a queue.
  - Requesting just slightly more than when you expect to need is generally the best practice
  - **Short jobs get higher priority, and short or small jobs are easier to schedule quickly**
- You can monitor your job's progress with `squeue`, `sstat`, `sacct`, `scontrol` or `slurmtop`
- Software is managed by Environment Modules
  - Use 'module avail' to find software packages
  - And 'module load' to load them into your environment
    - including within job scripts!
  - Use 'module purge' to return to a clean environment before loading a new set of modules
  - Other useful commands are 'module list' and 'module show'
