# Running jobs on the Prince Cluster

## Accessing the Prince Cluster

- From Windows workstation
- From Mac workstation

## Software and Environment Module

## Job script and resource request

- Introduction to job scheduling
- Submitting jobs with sbatch
- Requesting resources
- Using computing nodes interactively

## Monitoring batch jobs

- Monitoring batch jobs - squeue
You can compile, edit scripts and view results on the login nodes, but **computational work should be run on the compute nodes**

- You can access compute nodes with `srun`
  - Either via a job script, or interactively
  - Compute nodes are allocated to jobs by the scheduler, so your job might not start immediately
  - Jobs must request resources, but mostly need not specify a queue.
  - Requesting just slightly more than when you expect to need is generally the best practice
  - **Short jobs get higher priority, and short or small jobs are easier to schedule quickly**

- You can monitor your job’s progress with `squeue`, `sstat`, `sacct`, `scontrol` or `slurmtop`

Software is managed by Environment Modules

- Use `module avail` to find software packages
- And `module load` to load them into your environment
  - including within job scripts!
- Use `module purge` to return to a clean environment before loading a new set of modules
- Other useful commands are `module list` and `module show`
