Running jobs on the Prince Cluster

Accessing the Prince Cluster
From Windows workstation
From Mac workstation

Software and Environment Module

Job script and resource request
Introduction to job scheduling
Submitting jobs with sbatch
Requesting resources
Using computing nodes interactively

Monitoring batch jobs
Monitoring batch jobs - squeue
Pulling it all together - Preparing, submitting and monitoring a job on Prince

In this section we will prepare, submit and monitor a small R job. Our test case comes from the NYU Data Services “Introduction to R” tutorial

Exercise
Start a terminal session on Prince and replicate this example in it.

Choose your own example
After - or instead of - following this example through, prepare and submit a run of something genuinely relevant to your research. This way, if you are doing this tutorial in a classroom, the presenter will be available should you have questions or strike difficulties

We're using R, so first we'll look for available modules. On Prince:

$ module avail r

---------------------------------- /share/apps/modulefiles
----------------------------------
gstreamer/intel/1.10.2    mothur/intel/1.35.1    r/intel/3.3.2

There's a few modules starting with r, and a couple of versions of R. We'll use the latest version, 3.1.2.

$ module purge
$ module list
No Modulefiles Currently Loaded.
$ module load r/intel/3.3.2

Take a look at what it did:
... clearly, R uses a lot of other packages. The modulefile has looked after loading the correct ones.

```lua
$ module show r/intel/3.3.2
...
/share/apps/modulefiles/r/intel/3.3.2.lua:
...
whatis("R: a language and environment for statistical computing and graphics")
whatis("Name: r version: 3.3.2 compilers: intel")
load("intel/17.0.1")
load("jdk/1.8.0_111")
load("openmpi/intel/2.0.1")
prepend_path("MANPATH","/share/apps/r/3.3.2/intel/share/man")
prepend_path("PATH","/share/apps/r/3.3.2/intel/bin")
prepend_path("LD_LIBRARY_PATH","/share/apps/r/3.3.2/intel/lib64/R/lib")
prepend_path("PKG_CONFIG_PATH","/share/apps/r/3.3.2/intel/lib64/pkgconfig")
setenv("R_ROOT","/share/apps/r/3.3.2/intel")
setenv("R_INC","/share/apps/r/3.3.2/intel/lib64/R/include")
setenv("R_LIB","/share/apps/r/3.3.2/intel/lib64/R/lib")
family("R")
```

For our example, we'll get some code and data from `/share/apps/examples`.

```bash
$ mkdir /beegfs/$USER/R-example
$ cd !$
$ cp /share/apps/examples/r/basic/* .
```

Take a look at the job script:

```
```

Hint: there are usage examples for a few common packages here
$ cat my_R_job.s
#!/bin/bash
#SBATCH --nodes=1
#SBATCH --ntasks=1
#SBATCH --time=5:00
#SBATCH --mem=1GB
#SBATCH --job-name=myRtest
#SBATCH --mail-type=END
#SBATCH --mail-user=bob.smith@nyu.edu

module purge
module load r/intel/3.3.2

RUNDIR=$SCRATCH/R-example
mkdir -p $RUNDIR

cp /share/apps/examples/r/basic/example.R $RUNDIR

cd $RUNDIR
srun R CMD BATCH example.R example.out

There are a few steps we can try here:

1. Start an interactive batch session, and run the example.R script interactively
2. Close the interactive session, and submit the batch script as a job:

   $ sbatch my_R_job.s

You'll get a job id returned.

Is it running yet?

   $ squeue -u $USER

You could watch the output in the run directory:

   $ ls -l ${SCRATCH}/R-example

Finally, when the job finishes, you should see a .out file in the directory you submitted from.

**Exercise**

Experiment with sbatch options for the job name, output and error file merging and location, resource limits.
