You can get an estimate of the scheduled starting time for a job with `showstart`:

```bash
$ showstart 3546761

job 3546761 requires 12 procs for 15:00:00

Estimated Rsv based start in 00:43:58 on Tue Jul 4 15:04:56
Estimated Rsv based completion in 15:43:58 on Wed Jul  5 06:04:56

Best Partition: torque
```

Note that `showstart` is based on the scheduled time - which might be adjusted as other jobs are added to the queue and if already-running jobs finish ahead of time.

Also, if you've only just submitted the job, the scheduler might not have seen it yet. Moab only collects new jobs to schedule every ~15 seconds.
