## Working with Text Effects

Use the markup shown in the examples below to format the text in your pages.

<table>
<thead>
<tr>
<th>What you need to type</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>strong</em></td>
<td>strong</td>
</tr>
<tr>
<td>&quot;bold text&quot;</td>
<td>bold text</td>
</tr>
<tr>
<td><em>emphasis</em></td>
<td>emphasis</td>
</tr>
<tr>
<td><em>italics</em></td>
<td><em>italics</em></td>
</tr>
<tr>
<td><strong>superscript</strong></td>
<td>superscript</td>
</tr>
<tr>
<td><del>subscript</del></td>
<td>subscript</td>
</tr>
<tr>
<td>{{monospaced}}</td>
<td>monospaced</td>
</tr>
</tbody>
</table>

**Hint**: To italicise parts of a word, add braces (curly brackets) around the underscore. For example, Th*ing{ underscore}* gives you this: Thing

```markdown
??citation??
```

—citation

-**deleted**-

+**inserted**+

```markdown
^superscript^ 
```

*Hint*: There are two ways to make superscripts work in wiki markup, when used directly after another word or character:
- Add a space before the superscript. For example, kg/m ³ gives you this: kg/m³
- Add braces (curly brackets) around the superscript markup. For example, kg/m(^)³ gives you this: kg/m³

```markdown
~subscript~
```

script

```markdown
bq. Here’s how you make text in a paragraph into a block quotation
```
