Setting job priorities

If you have several jobs in the queue, and would like certain of them to be prioritized over others, you can set the relative priority of a job by submitting it with:

```
$ qsub -p priority job-script
```

Here:

- **priority** is a number between -1024 and +1023. A higher number means higher priority. The default priority is 0.

- **job-script** is the name of your job script

You can also pass -p as a PBS directive within your job script:

```
#PBS -p priority
```
