

Creating PDF in Another Language

To export a Confluence page written in a language other than English, you need to install the necessary font for that language. This means that you need to upload the font file to Confluence, as described below.

Uploading a Font File to Confluence

1. Find the appropriate font file:
 - **Windows users:** All font files in Windows are stored in a directory called:

```
C:\WINDOWS\Fonts
```

- **Unix users:** All font files in Unix are stored in:

```
/usr/share/fonts
```

- Microsoft True Type core fonts such as Verdana can be downloaded from this page: <http://corefonts.sourceforge.net/>
2. Copy the font file into a temporary folder, for example a folder on your desktop.
 3. Go to the '**PDF Language Support**' screen in the **Confluence Administration Console** and upload the file you copied in step 2.
 4. Click '**Install**'.

Notes

- The only font files supported are *true type fonts* and *true type collections*. The accepted file extensions are *.ttf and *.ttc.
- We recommend that you use Unicode font Verdana for correct character encoding and exporting to PDF.
