Web-Widget Macro

The **Web-Widget** macro is just another name for the **Widget macro**.

Confluence supports `web-widget` as an alias for `widget`. Your **System Administrator** can enable or disable one or both these macro names. The alias is useful for Confluence sites which use Adaptavist's **Community Bubbles plugin**, to avoid conflict with the 'widget' macro supplied by that plugin.

If the `web-widget` alias is enabled on your Confluence site, you can use `web-widget` instead of `widget` in all the examples given in the page about the **Widget macro**.
